Websites for real businesses and products of my own — each one taken from *first sketch* to a live site.

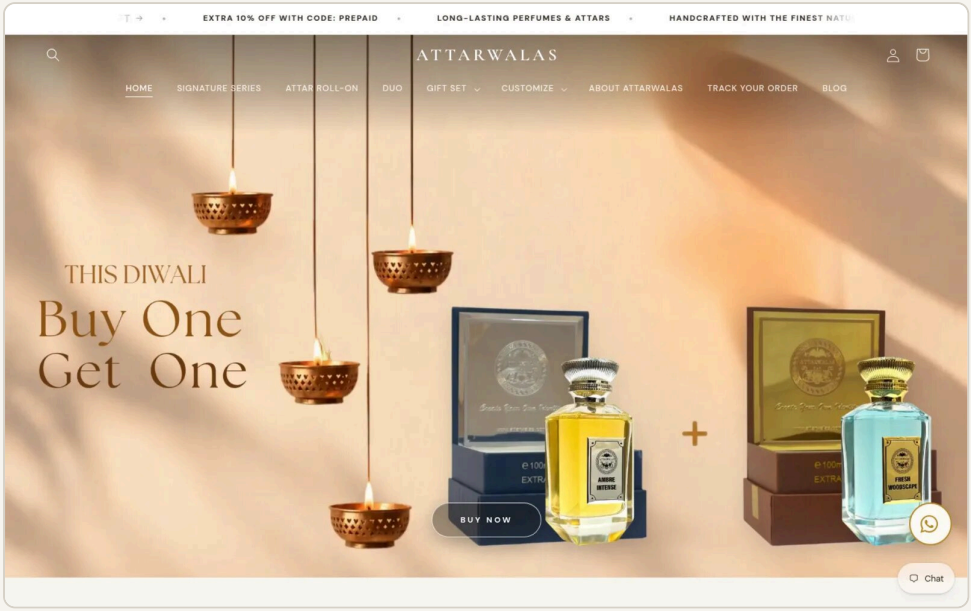

01	**Attarwala's** Client · Shopify store	Custom theme and a Shopify Function for pick-any-N bundle offers
02	**Deccan Cans** Client · Shopify store	Bulk tin catalogue with per-size rates and enforced minimum orders
03	**StreamVault** Personal product · Full-stack	Movie & TV discovery with its own multi-stage recommender
04	**Enlighten SEN Services** Client · Website	Next.js site for a special-education company, from design to domain
05	**Noitas** Personal project · Blog	A Hugo blog with a pixel-art game layer on every page
+	**More projects** Apps, AI tools, hackathons	App Blocker, Misinfo Detector, MediBase, Claw, Agentic AI, this portfolio

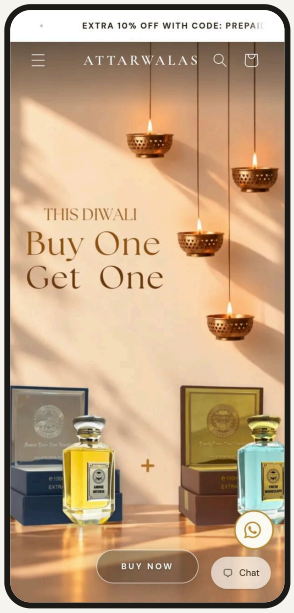

CLIENT WORK · 01

Attarwala's

Shopify store for a Mumbai perfume & attar house, in business since 1998

attarwalas.com ↗
Theme source ↗

I built the store's custom Shopify theme and still maintain it: new pages, offers, audits and fixes as the business needs them.

THE PROBLEM

The shop runs offers like *"Double Dhamaka: any 2 perfumes for ₹1,999"*. Shopify has no built-in way to charge a fixed total for a bundle the customer picks themselves, and fake "bundle products" would break inventory and the packing slips.

HOW I SOLVED IT

The offer page adds each chosen perfume as an ordinary cart line, tagged with hidden properties: a bundle id, the bundle price and the bundle size. A **Shopify Function** (a discount that runs inside checkout) groups the lines by bundle id and discounts them down to the bundle price.

Oud 80 ML	₹1,500.00
Aura 80 ML	₹1,500.00
Double Dhamaka	-₹1,001.00
Total	**₹1,999.00**

Stock, fulfilment and packing slips work normally because every perfume is a real item, and the customer sees what they saved. The price travels on the cart lines, so **one automatic discount covers every offer** the store will ever run. New offers need no code.

ALSO BUILT

- Mobile-first theme design
- Gift sets, customisation and order-tracking pages
- Ongoing audits and improvements

ROLE

Theme development & maintenance

YEAR

2026, ongoing

STACK

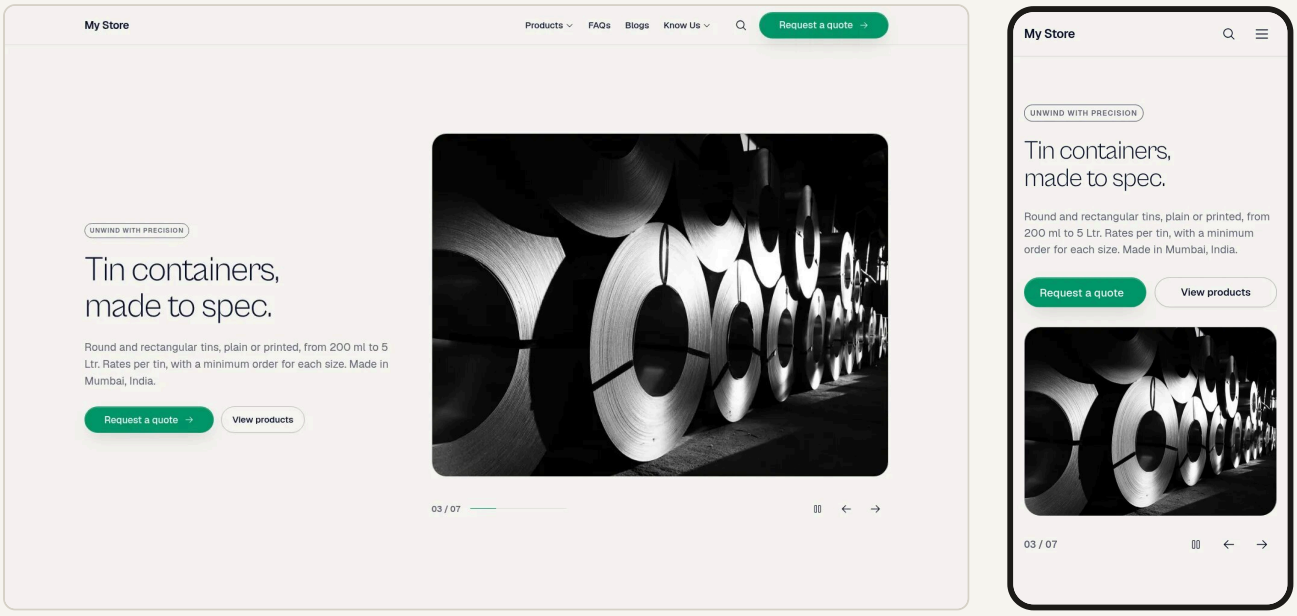

Shopify · Liquid · Shopify Functions · JavaScript

CLIENT WORK · 02

Deccan Cans

Shopify store for a Mumbai manufacturer of plain & printed tin containers

Store preview ↗

A new online store, built as a custom Shopify theme from scratch. Buyers pick a tin and a size, see the rate per tin and the minimum order, then order or ask for a quote.

THE PROBLEM

Tins are sold in bulk: every size has its own rate and a **minimum order quantity** in the thousands. Shopify's product page, cart and "Buy it now" button know nothing about minimums, so out of the box a buyer could order 50 tins.

HOW I SOLVED IT

Each size is a variant with its rate as the price and its minimum stored in a metafield. A **rate card** section lists every range with capacity, rate, minimum and minimum order value, and adds the minimum to the cart in one click. On the product page, size chips update the price, minimum and order value live, and the quantity stepper moves in hundreds from the minimum.

```
4 Ltr round tin                    Rs. 65.00 / tin
Minimum order                      1,000 tins
Typed 50 in the cart               → 1,000
Order value                        Rs. 65,000.00
```

The cart drawer, the cart page and "Buy it now" all clamp back up to the minimum, so no path through the store can under-order.

BUILT TO HAND OVER

- 29 sections and 18 templates, all with settings and presets, so the client edits every page in the theme editor
- A seed script uses the **Admin GraphQL API** to load the catalogue, metafields, metaobjects (FAQs, testimonials, clients), pages, menus and 89 redirects from the old site's URLs
- Tailwind v4 with a locked palette; small vanilla ES modules loaded per section; scroll motion and view transitions, all off under reduced motion

ROLE

Theme design & development, store setup

YEAR

2026

STACK

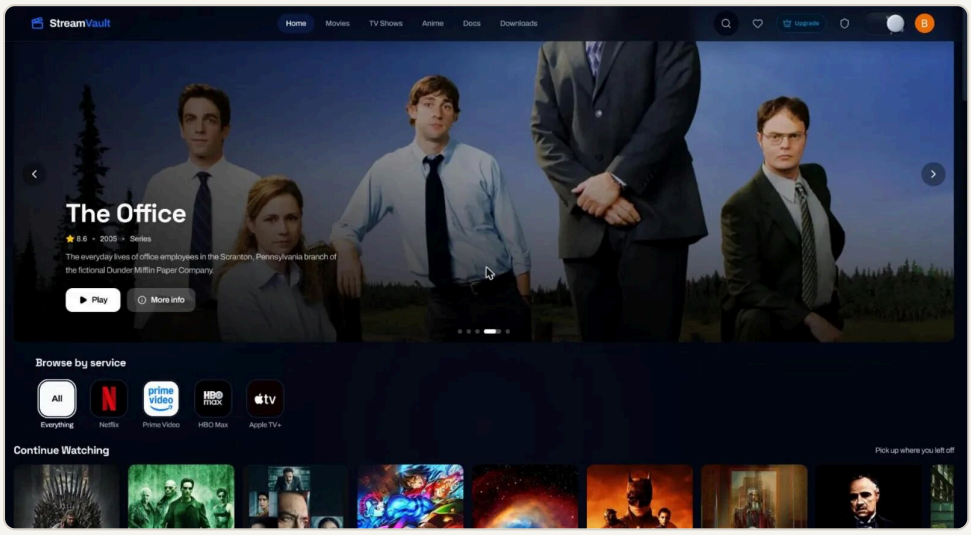

Shopify · Liquid · Tailwind CSS · JavaScript · GraphQL Admin API

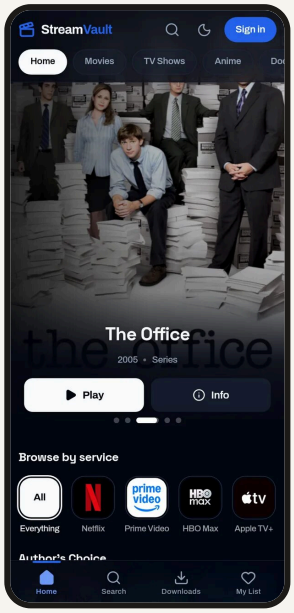

PERSONAL PRODUCT · 03

StreamVault

Movie & TV discovery platform with its own recommendation engine

Live site ↗
Source ↗

Built solo, end to end: the React frontend, the Express API, a Python ML pipeline and the infrastructure configs.

CINEMATCH: HOW RECOMMENDATIONS ARE MADE

01
Candidates
Nine sources: collaborative filtering; genre, cast, keyword and graph discovery; TMDB recommendations and similar titles; trending; a popular fallback. Merged with reciprocal rank fusion.

02
Filtering
Removes titles already watched, disliked, duplicated, low quality or in suppressed categories.

03
Ranking
Scores what's left with weights that refresh over time, corrects for position bias, adds exploration and re-ranks for diversity.

04
Mixing
Builds the home page as rows of sections, like a streaming service would.

THE ML PART

A **two-tower neural network** in PyTorch learns user and title embeddings from watch activity. A pipeline extracts the training data, trains the model and uploads the embeddings to Supabase, where the API reads them as one of its signals.

THE PRODUCT AROUND IT

- Browse by streaming service (TMDB watch-provider data); favourites and continue-watching
- Auth0 sign-in with 2FA, onboarding that seeds your taste profile, admin dashboard
- Redis caching, rate limiting, Helmet / CORS / HTTPS hardening
- Docker and Kubernetes configs, unit tests across the pipeline, Playwright end-to-end tests

ROLE

Solo: design, frontend, API, ML

YEAR

2026

STACK

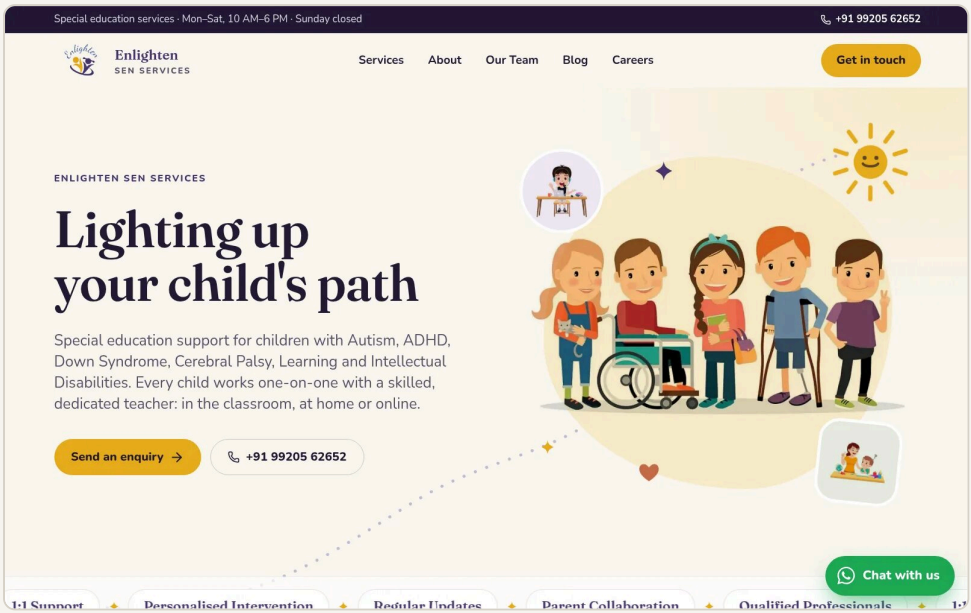

React · TypeScript · Express · Supabase · Redis · Python · PyTorch · Docker · Kubernetes

CLIENT WORK · 04

Enlighten SEN Services

Website for a Mumbai special-education (SEN) services company

enlightensenservices.in ↗

Enlighten places one-to-one teachers with children who have autism, ADHD, Down syndrome, cerebral palsy and learning or intellectual disabilities. I replaced their old PHP template site with a new one written for the parents looking for help.

WHAT I BUILT

- A fast **Next.js + Tailwind** site: home, a page for each of the five services, about, team, blog with post pages, careers and contact, plus sitemap and robots
- A warm visual identity built on their line *"Lighting up your child's path"*: a dotted trail, a smiling sun, sparkles and wavy colour bands, around the client's own illustrations
- Enquiry and career forms that post to a serverless route and **email the team through Resend**. If email is down, the form falls back to a pre-filled WhatsApp message, email or call
- Mobile polish: page transitions, an animated menu with call and enquiry buttons, and a floating WhatsApp button

LAUNCH

I moved the domain's DNS to Vercel and set up HTTPS (renews automatically), with www as the main address. Every push to `main` deploys automatically.

ACCESSIBILITY

Skip link, visible focus rings, semantic landmarks, an FAQ built on native `<details>`, and all motion turned off for people who prefer reduced motion.

ROLE

Design, development, hosting & domain

YEAR

2026

STACK

Next.js · React · TypeScript · Tailwind CSS · Resend · Vercel

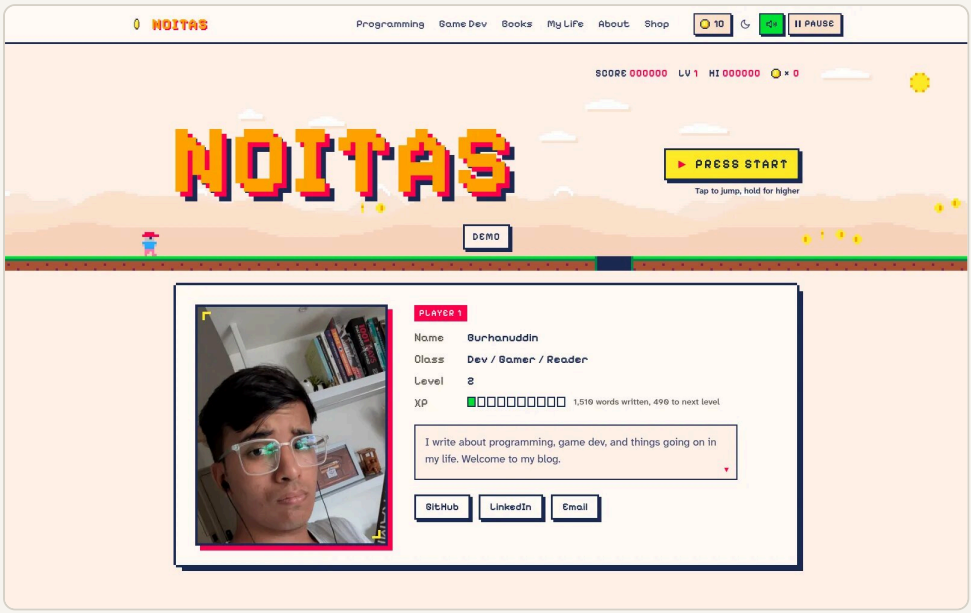

PERSONAL PROJECT · 05

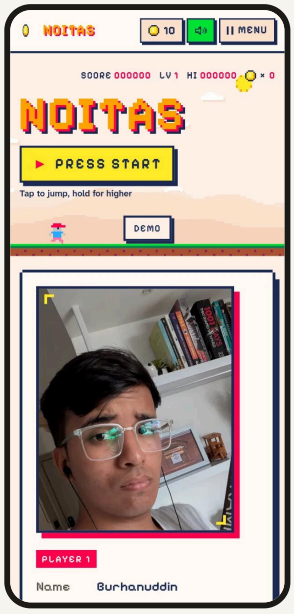

Noitas

My blog, with a small pixel-art game running through every page

burhan-blog.vercel.app ↗

Source ↗

I write about programming, game development, books and life. I wanted the blog to feel like a game, so the whole site has one built in.

THE TITLE SCREEN

A runner drawn on a low-resolution canvas and scaled up with crisp pixels. It plays itself in demo mode until you press start, Space or tap; then you jump crates, pits and bats, chain coins into combos and hit **?** blocks for short power-ups.

THE GAME LAYER

- Coins earned while playing and reading are saved in the browser and spent in an **item shop** on skins, permanent power-ups and colour palettes
- Achievements, secret levels, a pause menu and a CRT mode
- 8-bit sound effects and a soundtrack synthesised with the **Web Audio API**, started only after your first click or key press
- A “Player 1” profile card whose XP bar levels up with the words I have written

UNDER THE HOOD

Hugo with custom layouts, partials and shortcodes; about 1,700 lines of framework-free JavaScript modules for the game. Python scripts generate interactive Plotly charts that posts embed through a shortcode. Motion respects reduced-motion settings.

ROLE

Solo: design, game, writing

YEAR

2026

STACK

Hugo · JavaScript · Canvas · Web Audio · Python · Plotly

More projects

Apps, AI tools and hackathon builds

App Blocker

Android app · 2026

Locks an app for a set time with no in-app way to cheat. The only early exit is an unlock key signed offline.

- An **Accessibility Service** spots locked apps and sends you back to the home screen the moment they open
- While a lock runs, it also blocks the settings screens that could switch it off: Accessibility settings, Device Admin and the app's own uninstall page
- Registering as a **Device Admin** makes uninstalling a deliberate extra step
- Unlock keys are signed with a private key by a separate Python tool on my PC; the app only holds the public key and verifies them

I documented its limits honestly: it is a strong deterrent, not a guarantee. Safe Mode can still get around it without factory-reset device-owner provisioning.

Misinfo Detector

Hackathon · Mumbai Hacks 2025

A Chrome extension that fact-checks the page you are reading using a team of AI agents.

- Separate agents for summary, fact-checking, news cross-reference and bias
- A final "judge" agent weighs their findings and returns a verdict with a confidence score
- Works on a highlighted passage or on every headline on a page

STACK

Python · Flask · Chrome Extension · LLM agents

MediBase

Hackathon · REDACT 2025, SPIT

Predicts a likely condition from blood-test values and explains which values drove the prediction.

- XGBoost classifier over biomarkers such as troponin, CRP and cholesterol
- SHAP explanations for every prediction, with out-of-range values flagged
- Gemini turns the result into a plain-language summary

STACK

Python · XGBoost · SHAP · Streamlit · Gemini

Claw

AI assistant · 2026

A private assistant I talk to on Telegram that works across my Gmail, Calendar, Tasks and Drive.

- Summarises my inbox and drafts replies for me to review before sending
- Creates calendar events and manages my to-do list from a chat message
- Sends a short daily briefing of meetings, tasks and important email

STACK

LLM agent · Telegram · Google APIs

LINKS

burhanrajkot.github.io/claw-app

Agentic AI

Developer tool · 2025

A command-line coding agent that can read, write and run code inside a sandboxed project folder.

- Gemini function calling picks the right tool for a plain-English request
- Tools to list, read, write and delete files and to run Python scripts, returning their output
- Every file path is checked so the agent can never leave the working directory

STACK

Python · Gemini API

github.com/BurhanRajkot/agentic-ai

This portfolio

Website · 2026

My portfolio site, where a cloud of particles reshapes itself for each section as you scroll.

- Three.js particle system morphing between ten shapes (a perfume bottle, a tin can, a play button, a pixel heart and more), written as custom GLSL shaders
- GSAP scroll choreography with Lenis smooth scrolling; a full-screen mobile menu and a chapter pill that tracks where you are
- All content lives in one data file, so updating projects needs no component changes

STACK

React · TypeScript · Three.js · GSAP · Vite
